

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

TABLES OF THE MOON.

AMERICAN EPHEMERIS

AND

NAUTICAL ALMANAC.

TABLES

OF THE MOON;

CONSTRUCTED FOR THE USE OF

THE AMERICAN EPHEMERIS AND NAUTICAL ALMANAC.

BY

PROFESSOR BENJAMIN PEIRCE, LL.D.

PUBLISHED BY AUTHORITY OF THE SECRETARY OF THE NAVY.

BUREAU OF NAVIGATION, WASHINGTON.

Hosted by Google

University Press:
Welch, Bigelow, and Company,
Cambridge.

PREFACE

TO THE SECOND EDITION.

One of the first steps in the preparation of the American Ephemeris and Nautical Almanac, founded by Congress in March, 1849, was the collection of materials for new Tables of the Moon. The work was completed, and the first edition of the American Tables was published in 1853.

Since this preliminary step, however indispensable, unavoidably delayed the appearance of the Almanac, I am very solicitous to make known, here and elsewhere, the great obligations which American astronomical science is under to Hon. John P. Kennedy, then the Secretary of the Navy, for his just estimate of the magnitude and importance of this work. Although the processes by which it was conducted had formed no part of his study, its objects and value were perfectly understood by a scholar who had already adorned the literature of his own country by his writings.

The American Tables, as is stated in the title-page of the first edition, are "constructed from Plana's theory, with Airy's and Longstreth's corrections, Hansen's two inequalities of long period arising from the action of Venus, and Hansen's values of the secular variations of the mean motion and the motion of the perigee."

The formulas of Plana's theory were taken, not from Plana's own work, but from pages lxxiv. -lxxx. of the Introduction to the Reduction of the Observations of the Moon, made at the Royal Observatory, at Greenwich, from 1750 to 1830.

These formulas were adopted because they claimed to be corrected by Plana himself, and, what is of more importance, because they had been compared with observation, and formed the basis of Airy's corrections of the elements of the Moon.

The term 0".8 sin [23], which occurs in that formula, is very different from the corresponding term 3".3 sin [23], which is originally given by Plana; but it appears from the remarks given on page lxxxi. of the Introduction to the Lunar Observations, that this correction was adopted with the assent of Plana, and it was, therefore, attributed to Plana in the American Tables.

Airy's corrections of the Lunar elements were adopted from his Memoir in Vol. XVII. of the Memoirs of the Royal Astronomical Society. In making these corrections, the two inequalities given at that time by Hansen, and produced by the disturbing force of Venus, were introduced in the comparison. Therefore it was necessary to introduce these terms also into the American Tables, in order to have the theory which had been verified

PREFACE.

by observation. Very different values of these terms have since been given by Hansen, and are introduced into his Tables. A new set of corrections of the Lunar elements has also been made by Airy; but these corrections were published several years after the appearance of the American Tables.

Just before the final preparation of the American Tables, and when the first volume of the American Ephemeris was on the eve of completion, Longstreth's empirical corrections of Plana's formula for the Moon's longitude were communicated to me by their author; they were accompanied by a table of comparisons (published in the Memoirs of the American Philosophical Society for 1853) which sufficiently attest their value and propriety, and the forthcoming volume of the Ephemeris was delayed until the corresponding changes were computed and applied.

The present edition of the American Tables of the Moon is the same as the first, with the exception of the correction of typographical errors; the substitution of the Tables of the Moon's Parallax constructed from Walker's and Adams's formulas, in the place of the original Parallax Tables; and the addition of a Table adapted to a convenient modification of the method of computing the latitude, by Professor J. D. Runkle.

A third edition will shortly be issued, of which the basis will still be Plana's theory, while the Tables will be corrected to conform to the new Solar Parallax, and the corrected elements of the Moon's orbit.

Washington, Navy Department, March, 1865.

C. H. DAVIS,

Rear-Admiral, and Chief of the Bureau of Navigation.

I. CONSTRUCTION OF THE TABLES.

These tables are constructed from the theory of Plana, modified by the theoretical investigations of Hansen, and the empirical corrections of Airy and Longstreth.

The moon's mean longitude is also to be corrected by the two terms of long period, arising from the action of Venus, which were discovered by Hansen, and printed in the Astronomische Nachrichten, No. 597, and which are expressed by

 δ_h , θ = the correction of the mean longitude of the moon arising from the action of Venus.

The following notation is adopted,

```
\theta = the mean longitude of the moon,

\varpi = the longitude of the moon's perigee,

\eta = the longitude of the moon's node,

\theta_{\bullet} = the mean longitude of the sun,

\varpi_s = the longitude of the sun's perigee.

\theta', \theta'_{s}, \varpi'_{s}, and \eta' = the respective daily motions of \theta, \varpi, \theta_{s}, \varpi_{s}, and \eta.

\theta_{0}, \varpi_{0}, \theta_{s,0}, \varpi_{s,0}, \eta_{0} = the values of \theta, \varpi, \theta_{s}, \varpi_{s}, and \eta at any assumed epoch, as the beginning of the nineteenth century.
```

The values of θ , ∞ , &c., at any number of days *i* from this epoch are, from the formulæ of Plana, with the corrections given by Hansen in the Astronomische Nachrichten, No. 597.

```
\begin{array}{l} \theta &= \theta_0 + \theta' \, i + 8''.598 \, (10)^{-9} \, i^2 + 3''.6483 \, (10)^{-16} \, i^3 + \delta_{\rm h.} \, \theta, \\ \varpi &= \varpi_0 + \varpi' \, i - 27''.217 \, (10)^{-9} \, i^2 - 13''.750 \, (10)^{-16} \, i^3, \\ \theta_{\rm s.} &= \theta_{\rm s.0} + \theta'_{\rm s.} \, i + 0''.91584 \, (10)^{-9} \, i^2 + 0''.03879 \, (10)^{-16} \, i^3, \\ \varpi_{\rm s.} &= \varpi_{\rm s.0} + \varpi'_{\rm s.} \, i + 0''.91584 \, (10)^{-9} \, i^2 + 0''.03879 \, (10)^{-16} \, i^3, \\ \eta &= \eta_0 + \eta' \, i + 6''.0355 \, 10^{-9} \, i^2 + 2''.3744 \, (10)^{-16} \, i^2. \end{array}
```

The values of θ_0 , ϖ_0 , &c., and of θ'_0 , ϖ'_0 , &c., derived, for the mean noon of Washington of the date 1801, Jan. 0, from the values obtained by Airy in his Memoir upon the Corrections of the Elements of the Moon's Orbit, published in the Memoirs of the Royal Astronomical Society, Vol. XVII., and from Bessel's Tables of the Sun, are

```
\theta_0 = 10^{\circ} 55^{\circ} 40^{\circ} 5,

\theta_0 = 266 451.3,

\theta_{0.0} = 2795244.3,

\theta_{0.0} = 2793110.4,

\theta_{0.0} = 135552.6,

\theta_{0.0} = 135502808897,

\theta_{0.0} = 0 401.05783886,

\theta_{0.0} = 0 3548.32999304,

\theta_{0.0} = 0 190.63366070.
```

The assumed Western Longitude of Greenwich from Washington is 18^{h.} 51^{m.} 48^{s.} The notation

```
g''' = the mean anomaly of Venus,

z = the mean anomaly of the sun = \theta_* — \varpi_*,

u = the uncorrected mean longitude of the moon = \theta — \delta_h, \theta,

x = the mean anomaly of the moon = \theta — \varpi,

y = the mean argument of the latitude = \theta — \eta,

t = the argument of variation = \theta — \theta_*,

\tilde{u} = the true longitude of the moon,

\tilde{y} = the true argument of the latitude,

Q = the mean heliocentric longitude of Venus,

\Theta = the mean heliocentric longitude of the earth = 180^\circ + \theta_*,

\mathcal{Y} = the mean heliocentric longitude of Jupiter,

H = 8 g'' - 13 z + 315^\circ 30',

H' = 18 g'' - 16 z - x + 35^\circ 20'.2,
```

gives the following formulæ for the longitude, latitude, and horizontal parallax of the moon.

In writing these formulæ, most of the arguments are expressed by numbers, in which the digit occupying the place of units is the coefficient of x, that in the place of tens is the coefficient of t, that in the place of hundreds is the coefficient of t, that in the place of thousands is the coefficient of t, and that in the place of tens of thousands is the coefficient of t. The accents upon the numbers indicate that the coefficient is negative. Thus the number of the argument t0 denotes

$$u-4y+2z+5t-3x$$
.

The form of the formula of the longitude is modified simply by substituting the term dependent upon the true arguments of the latitude, instead of the equivalent terms. This is accomplished by adding to the formula of longitude the equation,

```
\begin{array}{l} 0 = -416''.7 \sin 2\bar{y} + 411''.7 \sin 2y + 4''.1 \sin (2y + 2x), \\ + 0''.9 \sin (2y - 2x) - 46''.0 \sin (2y - x) + 45''.2 \sin (2y + x), \\ + 0''.3 \sin (2y + 3x) - 9''.3 \sin (2y + x - 2t) + 8''.8 \sin (2y - x + 2t), \\ + 0''.9 \sin (2y + x + 2t) + 0''.1 \sin (2y - x - 2t) - 0''.4 \sin (2y + 2x - 2t), \\ - 0''.5 \sin (2y - 2x + 2t) + 5''.7 \sin (2y + 2t) - 3''.8 \sin (2y - 2t), \\ - 0''.4 \sin (2y - x + z) - 0''.4 \sin (x + z - 2y) - 0''.2 \sin (2y - 4t + x), \\ + 1''.0 \sin (2y - t) - 0''.7 \sin (2y + z) + 1''.3 \sin (2y - z), \\ - 0''.4 \sin (x - 2t + z + 2y) + 0''.3 \sin (2t + 2y - z) + 0''.3 \sin (2t - z - 2y). \end{array}
```

The form of the formula for latitude is modified in a way which is evident from inspection of the formula, and which is designed to obviate the necessity of correcting the arguments for the change from mean to true longitude. The formula of parallax is retained in Plana's form.*

The terms of the various equations are given in the first column of the following tables of the formulæ united with the constants which are employed in the construction of the tables. The second column contains the initial letter of the authority for the corresponding coefficients of the equation, whether Plana, Airy, or Longstreth. The letter is accented when the value of the coefficient is modified by the present form of the tables. The third column contains the period of the argument expressed in mean solar days. The fourth column contains the number of the argument. The fifth column contains the number of the table which gives the values of the equation.

^{*} See Formula, page 305.

This value of the Moon's Semidiameter is that deduced by Burckhardt from eclipses and occultations, and should be used for the computation of these phenomena. But for Meridian Observations it seems to vary with the telescope ranging from 2" to 3" greater than the value here given.

The Principal Terms of the Second and Fourth Differences of the Longitude for a Quarter of a Day are given in the following formulæ.

Since Hansen's inequalities of long period, arising from the action of Venus, affect the mean longitude of the moon, they must be applied to the several arguments contained in Tables Va. or Vb., and to render these corrections always additive the arguments in Tables IIa. and IIb. have been diminished by the following constants:—

Arg. 1 by 0.001859,	Arg. 8 by 0.0012,
Arg. 2 by 0.001410,	Arg. 9 by 0.0012,
Arg. 3 by 0.001214,	Arg. 10 by 0.0010,
Arg. 6 by 0.0013,	Arg. 11 by 0.0011,
Arg. 7 by 0.0011,	Arg. 13 by 0.0012.

And Tables Va. and Vb. have been constructed by the formulæ,—

II. DESCRIPTION OF THE TABLES.

Tables Ia., Ib., and Ic. are Tables of Astronomical Dates in mean solar days reckoned from the beginning of the Julian Period, from which the date of any event can be reduced to days and decimals of a day when it is originally given in the usual form with reference to the Christian Era.

Tables IIa. and IIb. contain the values of the mean longitude, the negative of the longitude of the node, and all the arguments for the mean Washington noon of every thousandth day from 2300000 to 2500000.

Tables IIIa. and IIIb. contain the motions of the mean longitude, and of the longitude of the node for every interval of days and fractions of a day less than 1000 days, and the first ten multiples of all the periods.

Table IV. contains the constants by which the mean longitude, and the longitude of the node, and the various arguments, can be reduced, from the interval from 2400000 to 2500000 days to any previous time after the commencement of the Julian Period.

Tables Va. and Vb. contain the corrections of the various arguments for Hansen's term of long period in the action of Venus.

Tables VI. to LXXXII. inclusive contain the different equations of the moon's longitude.

Tables VI". to XXXVII". inclusive contain the second differences for a quarter of a day of the moon's longitude.

Tables VI. IV. to XVI. IV. inclusive contain the fourth differences for a quarter of a day of the moon's longitude.

Tables LXXXIII. to CIX. inclusive contain the terms of the moon's latitude.

Tables CX. to CXXVII. inclusive contain the terms of the moon's horizontal parallax.

Table CXXVIII. contains the table for the moon's semidiameter.

III. USE OF THE TABLES.

- 1. Reduce the instant for which the moon's place is to be computed to its date in days and decimals of a day from Washington mean noon, by means of Tables Ia., Ib., and Ic. The number of days for the beginning of the year is to be found in Table Ia., that for the day of the year in Table Ib., and the decimal of the day in Table Ic.
- 2. Find the longitudes and arguments for the date from Tables IIa., IIIa., IIIa., IIIb., Va., and Vb.

If the date is contained within the interval 2300000 to 2500000 days,

Find the value of the longitude or argument for the preceding thousandth day in Table IIa. or IIb., in the column headed with the name of the longitude or argument; multiply the number which is contained in the column headed with the accented name of the longitude or argument by one thousandth part of the excess of the date over that of the preceding thousandth day. Find in Table IIIa. the motion of the longitude for this excess of days.

The sum of the three numbers thus found for each longitude is the mean longitude for the date, and the sum of the two numbers for each argument and of the excess of the date over that of the preceding thousandth day is the argument for the date. The argument thus found must be reduced by substituting as many entire multiples of the period of the argument as it contains, and Table IIIb. will facilitate this process of reduction. Finally, correct the argument by the addition of the corrections contained in Tables Va. and Vb.

If the date is less than 2300000 days,

Change the hundred thousands of the date to 24; find the longitude and arguments by the preceding process for the changed date, with the exception of the corrections contained in Tables Va. and Vb. Take from Table IV. the constants of longitude and argument which correspond to the hundred-thousandth day next preceding the given date. Multiply the excess of the date over the next preceding hundred-thousandth day by the accented number of which the logarithm is given in the column of Table IV. next following the longitude or argument to which it corresponds when it is of sufficient magnitude to be noticed. Multiply the square of this excess by the doubly accented number of which the logarithm is given in the column of Table IV. next following that of the singly accented number, when it is of sufficient magnitude to be noticed. The sum of these two products, added to the constant, and corrected by the addition of the correction of Tables Va. and Vb. is the total addition to be made to the longitude or argument obtained by the preceding process.

3. Find, by means of the several arguments, the equations of longitude contained in the Tables VI. – LXXXI4. inclusive, and add their sum to the value of u already obtained.

It is to be observed, in entering Tables XVII., LIII., and LXXVIII., that

Arg. 12' = Arg. 12, but that the period is half as long. Arg. $48' = \text{Arg. } 48 - 6^{\text{d}}.26$, and it has a half-period. Arg. $73' = \text{Arg. } 73 + 173^{\text{d}}.792$, and it has a half-period.

4. To the sum of u and the equations of longitude add the value of y - u already obtained, and this sum is \bar{y} , which is the argument with which Table LXXXII. is to be entered for the final equation of longitude, which is to be added to the sum of u and the other equations in order to obtain the true longitude, \bar{u} , of the moon.

5. Find the value of A by entering

```
Table LXXXIII. with the Arg. 12'' = \text{Arg. } 12 - 43.3275, Table LXXXIV. with the Arg. 73''' = \text{Arg. } 73 + 47.5826, Table LXXXV. with the Arg. 53' = \text{Arg. } 53 - 29.38, Table LXXXVI. with the Arg. 1' = \text{Arg. } 1 + 6.89, Table LXXXVII. with the Arg. 70' = \text{Arg. } 70 - 82.45, Table LXXXIX. with the Arg. 4 Table XC. with the Arg. 5' = \text{Arg. } 5 + 51.47.
```

The value of A is the sum of the equations thus obtained increased by 17600".

6. Find the value of B by entering Tables LXXXIII. to XCI. inclusive (excepting Table LXXXIX.) with the arguments respectively written above them.

The sum of the equations thus obtained diminished by 1000'' is the value of B.

7. Find the remaining equations of the moon's latitude by entering Tables XCII. to CIX. inclusive with the arguments respectively written above them.

The sum of the equations thus obtained, diminished by 60", and added to the sum of the products of A by $\sin \bar{y}$, and of B by $\cos \bar{y}$, is the moon's latitude.

- 8. The moon's equatorial horizontal parallax is found by entering tables CX. to CXXVII. inclusive with their respective arguments, and adding 3000" to the sum of the equations thus obtained.
- 9. The moon's equatorial semidiameter is found by multiplying the equatorial horizontal parallax by 0.272274, which product may be readily obtained by means of Table CXXVIII.

This value is to be used for the computation of eclipses, but in the reduction of meridian observations it should be increased by 2".5 in the case of a telescope for which no special investigation has been made, or by whatever constant may be found suitable by a special investigation for each telescope.

10. Directions for the Computation of an Ephemeris. The longitude, exclusive of nutation and the equation of Table LXXXII., should be found for each successive noon; and also the second and fourth differences of the equations for a quarter of a day from the Tables VI. to XXI. in clusive.

If then the following notation is adopted,

 u_t = the longitude for the time t in days, exclusive of nutation and the equation of Table LXXXII.

 A_t = the sum of all those equations for which tables of second differences are given.

 A'_{t} = the sum of all those equations for which tables of second differences are not given.

 B_t = the sum of all the tabular second differences from those tables for which tables of fourth differences are given.

 B'_{i} = the sum of all the tabular second differences from those tables for which tables of fourth differences are not given.

 $B''_{\iota} = B_{\iota} + B'_{\iota}.$

 C_t = the sum of all the tabular fourth differences for all the equations for which they are given.

 $\Delta^n V_t$ = the *n*th differences of the series of n + 1 numbers

$$\begin{array}{lll} V_{t-\frac{1}{6}n}, & V_{t-\frac{1}{6}n+\frac{1}{6}}, & V_{t-\frac{1}{6}n+\frac{1}{2}}, & V_{t-\frac{1}{6}n+\frac{3}{4}}, & c., \\ V_{t+\frac{1}{6}n-\frac{3}{6}}, & V_{t+\frac{1}{6}n-\frac{1}{2}}, & V_{t+\frac{1}{6}n-\frac{1}{2}}, & V_{t+\frac{1}{6}n}, \end{array}$$

of which the first corresponds to the date preceding the date t by $\frac{1}{8}n$ days, and the last corresponds to the date which follows the date t by $\frac{1}{8}n$ days, and the intermediate numbers are at intervals of a quarter of a day apart.

 $\Delta^m V_t =$ the *n*th quarter difference of the values of the n+1 numbers

$$\begin{array}{lll} V_{t-\frac{1}{2}n}, & V_{t-\frac{1}{4}n+1}, & V_{t-\frac{1}{4}n+2}, & V_{t-\frac{1}{4}n+3}, \&c., \\ V_{t+\frac{1}{2}n-3}, & V_{t+\frac{1}{2}n-2}, & V_{t+\frac{1}{2}n-1}, & V_{t+\frac{1}{2}n}, \end{array}$$

of which the first corresponds to the date which precedes the date t by $\frac{1}{2}n$ days, and the last corresponds to the date which follows the date t by $\frac{1}{2}n$ days, the intermediate numbers

occurring at intervals of a day. In taking these quarter differences, all the terms of each order of difference are to be divided by four, before their quarter differences are obtained in the same way.

In the following computations it will be sufficiently accurate to put

$$\begin{array}{lll} \Delta^4 & V_t = \Delta'^4 & V_t, \\ \Delta^2 & V_t = \Delta'^2 & V_t - \frac{5}{4} \; \Delta'^4 \; V_t. \end{array}$$

Find for each noon and interpolate by differences for every six hours

$$\Delta^4 u_i = C_i + \Delta^2 B_i + \Delta^4 A'_i - 1''_{\bullet}$$

Test the accuracy of B_t by the formula

$$\Delta^2 B_t = C_t + \frac{3}{4} \Delta^2 C_t - 1''$$

Find for each noon

$$\Delta^2 u_t = B''_t + \Delta^2 A'_t - 130''_0$$

Find for each day and for the instant 3ths of a day after the noon

$$\Delta^3 u_{t+\frac{1}{3}} = \Delta B''_{t+\frac{1}{2}} + \Delta^3 A'_{t+\frac{1}{2}} + \frac{1}{2} \Delta^4 u_{t+\frac{1}{2}}.$$

Interpolate the remaining third differences of u_t by means of the fourth differences, being careful to adopt a judicious distribution of the small changes which are required in the fourth differences to accomplish this interpolation.

Interpolate the second differences of u_t with a similar regard to changes of the third differences.

Test the accuracy of A_{ι} by the formula

$$\Delta^2 A_t = B''_t + \frac{5}{4} C_t + \frac{5}{4} \Delta^2 B'_t - 130''_t$$

Find for each day and the instant 3ths of a day after the noon

$$\Delta u_{t+\frac{1}{3}} = 3^{0} \ 1058''.757 + \Delta A_{t+\frac{1}{2}} + \Delta A_{t+\frac{1}{3}} + \frac{1}{3} \Delta^{2} u_{t+\frac{1}{3}} - \frac{1}{4} \Delta^{4} u_{t+\frac{1}{4}}.$$

Interpolate the first differences of u_t by the aid of the second differences, and by them interpolate the values of u_t .

The values of \bar{y} should be obtained for each quarter of a day, and thence the equations from Table LXXXII.

The various terms of the latitude and horizontal parallax need only be found for each noon, except A. $\sin \bar{y}$, which, after the interpolation of A., should be computed for each quarter of a day.

11. Example.

Find the moon's longitude, latitude, equatorial horizontal parallax for the date B. C. 413, August 27, at 6 o'clock in the afternoon, mean solar time at Athens.

Solution. The western longitude of Athens from Washington being 17^h 16^m 53^h, the given date is in Washington time —413 August 26^d 23^h 16^m 53^s. This is reduced to the Julian date in days by Tables Ia., Ib., and Ic.

siciamo	500 years is in Julian date	in days 1538798.
	13 <i>B</i> .	31777.
Aug.	26	238.

-413 Aug. 26 ^{d.} 23 ^{h.} 16 ^{m.}	53"	1570813.970057870

By substituting 2400000 for the 1500000, the date becomes 2470813.970057870, whence from Tables II. to V. inclusive the arguments are obtained as follows:

#### TABLES

## OF THE MOON'S PARALLAX.

These tables are constructed from the formulæ given by Walker in a report to Prof. Bache, the Superintendent of the Coast Survey, and printed on the 114th page of the Coast Survey Report for 1848; and from those given by Adams on the 263d page of Volume XIII. of the Proceedings of the Royal Astronomical Society of London. They are substituted for the Tables given in the first edition of this work.

The Latitude  $\equiv A \sin \bar{y} + B \cos \bar{y} + C$ , as given on page 12, Introduction, may be put in the form, Latitude  $\equiv 18500'' \sin \bar{y} + A' \sin \bar{y} + B \cos \bar{y} + C$ ,

in which A' only differs from A in that the constant 900" is subtracted instead of the constant 17600" added. Compute 18500"  $\sin \bar{y}$  for each noon and midnight from Table CXXXVII.; compute  $A' \sin \bar{y} + B \cos \bar{y} + C$  for each noon, using five place decimals, and interpolate to midnight. In Table CXXXVII., the columns headed P. P. are the proportional parts for the seconds of  $\bar{y}$ .

Equation =  $18500'' \sin \tilde{y}$ .
